Imidazole-derivatives having agonistic or antagonistic activity on the histamine H₃-receptor.

The invention relates to novel imidazole-derivatives. The invention in particular relates to novel imidazole-derivatives having agonistic or antagonistic activity on the histamine H₃-receptor. More in particular it relates to isothioure-
5 a-, guanidine- and amidine-derivatives. The invention further relates to the synthesis of such compounds, a pharmaceutical composition comprising such compounds or pharmacological acceptable salts thereof, the use of the compounds as agents having biological activity, as agents
10 with agonistic or antagonistic activity on the histamine H₃-receptor or for preparing a pharmaceutical composition.

In addition to the already longer known histamine H₁- and H₂-receptors there is also a third type histamine-receptor present in the human body, the so-called H₃-receptor. De H₃-receptor is a presynaptic receptor, i.e. it is
15 located on a cell releasing histamine and stimulation of the receptor leads to inhibition of the histamine-release. Furthermore stimulation of the H₃-receptor influences also the release of other neurotransmitters, such as e.g. serotonin and acetylcholine. H₃-receptors are located in the
20 central and peripheral nervous system, the lung tissue, the intestine and probably also in the spleen, the skin and the gastro-intestinal tract. A number of compounds having an effect on H₃-receptors has already been described. For a
25 review see Schwartz et al., Agents and Actions 30, 1/2 (1990) p. 13-23.

Chemical compounds can stimulate or inhibit the histamine H₃-receptor (Timmerman, J. Med. Chem. 33, p. 4-11 (1990)). Now a group of new imidazole-derivatives

Pharmacological experiments

The agonistics and antagonistics activities on the H_3 -receptor of the various compounds were determined compared to histamine. The testmethods used therefor are described in
5 Van der Werf et al., Agents and Actions 20, 3/4 (1987)
p. 239-243 and Menkveld et al., European Journal of Pharmacology, 186 (1990) p. 343-347.

The results of the experiments are given in the tables below. pD_2 is the negative logarithm of the concentration of the testcompound at which 50% agonistic activity
10 was measured. pA_2 is the negative logarithm of the concentration of the testcompound at which the concentration of the agonist had to be doubled to obtain the same effect as obtained when the antagonist was absent.

15 Pharmaceutical compositions, comprising compounds of formula I as defined in claim 19 as the active ingredient for therapeutically influencing the human and animal histaminergic system have the form of powders, suspensions, solutions, sprays, emulsions, unguents or creams and can be used
20 for local application, intranasal, rectal, vaginal and also for oral or parenteral (intravenous, intradermal, intramuscular, intrathecal etc.) administration. Such compositions can be prepared by combining (i.e. by mixing, dissolving etc.) of the active compound of formula I in the form of a
25 free acid or salt with pharmaceutically acceptable excipients with neutral character (such as aqueous or non-aqueous solvents, stabilizers, emulsifiers, detergents, additives), and further if necessary colouring agents and flavouring agents. The concentration of the active ingredient in a pharmaceutical
30 composition can vary between 0.1% and 100%, depending on the nature of the influence and the method of administration. The dose of the active ingredient that is administered can further be varied between 0.1 mg and 100 mg per kg body-weight.
